Example 1.

A few days ago, I took anywhere between 80-150mcg of LSD in the late afternoon. I estimate it to be on the lower end of the dosage, because the whole thing was less intense than my previous LSD experiences. About six hours in, there were almost no effects anymore, and I was actually a little bored and ready to go to bed. I smoked some weed to make it easier to eat a small meal. Despite the weed, I was pretty lucid: I was able to read a book for about an hour while listening to music. There were still some effects, but not many: usually I will be very stimulated/novelty-seeking at this point in an acid trip. Now I just tired but unable to sleep.

This was not satisfying. After some consideration, eight hours into the trip, I decided I would smoke a small amount of salvia. I thought, if nothing else, it might sedate me a little further so I can go to sleep afterwards and have interesting dreams.
I weighed 0.1g (probably less, I wanted to be on the safe side) of 5x extract to smoke, put on ambient music, sat own comfily on the carpet, and took 1 hit.

After a few seconds, I knew it was working: gravity became 10x heavier, and time slowed down immensely. I looked down at my hands and to my side to the bag of salvia. My vision was vibrating, and I wondered if this had already happened. How long had I been sitting here? This felt like it repeated 10 or 20 times. I was actually excited, although a little nervous. I told myself: 'This is normal, this is the salvia, and this will pass'. The time loop continued for a little while longer. I had some internal hallucinations where I walked into an abstract party in a dark forest. The time distortion I had not experienced on salvia before, so it scared me a little. I was scared to lose myself in the experience and kept reminding myself I was under the influence. After a few minutes of these loops and confusion, I managed to get up and walk around again.

At that point, time returned to its 'normal' speed again, and what's better, the salvia had somehow rebooted the effects of the LSD. Although there were no obvious visual effects anymore, I was suddenly feeling very stimulated, music sounded extremely nice again, I was definitely not tired and instead wanted to run, dance, and draw/paint. (all of which I indulged in for the next 2 hours).
I also experienced cognitive euphoria: I felt really lucky not to have gotten stuck in some time loop while also on acid and weed. I realized this all could have gone in a very different and scary direction, but the salvia had in fact resulted in exactly what I wanted: novelty and stimulation. Those last hours felt like a small party to celebrate that everything was alright.

I tried searching around a bit to find similar positive experiences but couldn't find any. I'm curious if other people have experienced this.

I'm also curious about how these interactions work, because I really felt the LSD was 'reactivated' by the salvia (or at least by its after effects). I guess that

Example 2.

There aren't too many PCPr based compounds floating around out there. The only comparisons I have are MXPr and 3,4-MD-PCPr. Both of which are quite unique. It is still hard to get a read on the general "vibe" of the propylamine series. What can be seen now is the pattern for 2'-Oxo-substituted arylcyclohexylamines. A methyl group has moderate affinity, activity spikes with an ethyl, and then falls back down again for a propyl, and presumably falls further with longer carbon chains (As an aside there is evidence that a sec-butyl amine is actually quite active and potent! But I maintain the prediction that an aliphatic (straight chain) butylamine would see a steady drop in affinity from the aliphatic propyl). The isopropyl configuration additionally seems to bind better than the long aliphatic propyl. This pattern is also seen in the 3-phenyl substituted analogues (in this case, MXM, MXE, MXPr, and MXiPr)- in which MXE is the most potent, MXM has a similar potency to MXPr, and MXiPr falls somewhere in between. (As an odd aside, per Abelian's dissertation, the affinities of MXPr and MXiPr are actually higher than MXE! This is a case of affinity not fully correlating to in-vivo potency). This pattern maps on to the simple phenyl substituted ACH's to some degree, and this is seen in Jason Wallach's dissertation, though in this case, the methyl has a significantly lower affinity than the propyl. No idea how that would map onto in-vivo potency though, as we can see with the MX- style compounds, there is a clear divergence in that correlation sometimes.

Anyways, I digress, none of these numbers tell us what this drug is actually like! O-PCPr is short acting, heavy, smooth, insightful, suggestible, and ever so slightly stimulating beneath the heaviness. The headspace is fairly lucid throughout. Motor skills are pretty compromised, visuals are dark and neutral and indistinct. There are rushes of euphoria throughout. I think it is a fun compound that lends itself to casual use. If I want to make comparisons, it is like a more stimulating DCK. It bears little similarity to O-PCE or MXPr for that matter, it is a manageable headspace, there is no stultifying confusion. Even at moderate doses I was able to pull myself out of it and focus and function (which I did, during a devastating neighborhood crisis on one occasion). But it was nice to just sink in and get couchlocked by it. It is cozy and comfortable and smooth.

I will note that this compound seemed to slightly aggravate bladder and urinary symptoms. I am not sure if this is a personal sensitivity but I would suggest users to be vigilant of such effects and report them if experienced!

Start reading from here!

T0:00- Dose administered intranasally. Mild sting. Odor reminiscent of latex housepaint. Listening to Dub and relaxing on the couch.

T0:05- Spouse is telling me about intertidal spiders. I never knew those existed! I'm reading about marine insects now, the sea striders, Halobates. There is a slight dizziness but there is already an inquisitive and focused

headspace that drives me to read about things, similar to what I experience from psychedelics. Some numbness and softness and clumsiness in my extremities already.

T0:08- It is hitting so fast. I am very dizzy. The room is spinning. My thoughts are still focused but it feels like they're starting to trip up on each other a little now and move more slowly. There is a distinct euphoric rush. It is hitting fast. I feel like I am sitting on an inflating balloon. Tracers begin to present visually.

T0:15- My head feels heavy, like there is a big metal cube inside of it. I am so dizzy, it feels dizzying to have my airy body support such weight. The room suddenly feels so drafty. There is a phantom sensation of wind all across my skin. I feel like I should be cold but I'm not. It feels like my entire body is wobbling and rippling in slow motion. It's all so slow. My limbs are starting to feel so heavy and droopy like well-packed clay. There are open eyed visuals presenting as a sort of static or rainbow visual snow. There are no distinct patterns other than neat arrays of dots in a grid.

T0:30- I smoke a little bit of cannabis. I have just enough motor control for that. I feel so dense, everything is hitting so fast. Sounds are beginning to flange and reverberate. It feels like my entire visual field is shaking and flashing. I feel so heavy but my limbs also feel inflated by helium, it is as if all parts of me are floating up except for a dense heavy core anchoring the great balloon that is my consciousness and its perceptions of my body. I feel like a ball of lead on a vast plane of foil, sinking down and pulling the swirling ribbons of physicality around it as they dance in the persistent winds. I am a rock in the storm. There is such a gleeful rush to this feeling. My personal form is drooping and taking the form of the couch beneath it. I am sinking and sinking. I also need to pee. I am easily able to will myself up and walk upstairs, quite unsteadily.

T0:40- I am pretty dissed but I am able to talk to my spouse coherently. We chat about aquatic spiders and the behaviors of different spiders around water, like how fishing spiders will use the surface of water like an orb weaver would use its web- a vast vibrational field that can sense disturbances so they can be pursued. I too feel like the dainty hairy feet of the great Dolomedes spiders on the rippling surface of something immensely deep and dark. A hot air balloon drifting over a vast sinkhole. But instead of airy updrafts, the breeze pulls me in, deeper into its mouth, deeper into the hole. The depths beckon; I

plug in headphones, turn off the lights, and play The Books' final album "The Way Out", a beautiful sound collage with excerpts from hypnosis and autogenic instructional tapes. I don't normally opt for music with human voices so this proves to be an interesting experience.

I lie down and my body collapses into a puddle of quicksilver, dense and conforming to the surfaces it lies upon. Dim forms begin to materialize and loom over me, it feels like an entire shadowed world is laid out before me, an obscure geography begins to manifest in the sinuous violet deep rolling plains and unctuous pools and marshes before me, but as my balloon drifts over this nocturne fen-scape it seems the landscape comes up to greet me, geography folding in to encapsulate me, with the opaque black mirror still tannin bogs to my back, the tickling of the marshgrasses on my front and above me a hazy pastel twilight sky with no sun. This is a hole where my form feels relatively still in the mist, graced by the swirling dissociative winds, ready to be greeted upon by the synesthetic reactions to other stimuli. And so the multisensory and synesthetic experience continues onwards throughout the twists and turns of "The Way Out", and in here I begin to feel my reaction-cognition suddenly grow more sensitive and unprotected as if bared away by the steady breeze: I keep finding unnerving little dysphonic notes in the music that I may not have sensed before; I can feel my thoughts spiraling fractally outwards in response to perceived negative stimulus hits from certain sounds. It all feels too exposed, it all feels too vulnerable. I feel like my brainstuff is on display, I feel at the mercy of a chemical that has laid my mechanisms bare. Thankfully this chemical is benign. All it will do with my neurons is slather them in buzzing syrup and let then all soak together. They will relax in their salon and feel sensitive and suggestible and safe.

There is still little sense of motion beyond slow and consistent following along tracks lacking something in dynamics of motion. As I ever so slowly drift, images and forms do still coalesce around my consciousness, fold in from the environment to make themselves apparent to me. This is a very solipsistic and lonely hole. With some compounds, the hole makes me feel like I am a visitor to a realm of titans. This hole makes me feel as though I am slowly drifiting through ancient and forgotten ruins, wind bellowing through their empty halls like a de Chirico painting, places that have been empty since before the temple of human cognition had been crafted.

The structure of this twilight hole is expansive, mountainous, stoic and still, even as forms matter-of-factly and placidly replicate and recur upon themselves like hopper crystals. There was always a sense of things coming together, building heavier, ever heavier. My perceptions of physical self also did not feature much distortion or alteration, I was always a still body in the gentlest breeze, at times cocooned, entombed or locked into armor or sarcophagi or mysterious pods, most motion was me simply being still and being manipulated by other perceived physical forces. Other dissociatives holes I could feel like my physical self was being twisted, bent, folded, expanded and contracted in impossible ways, but beyond a persistent floppy sinking feeling, this was not the case here. The nature of the hole was neutral,

and I suspect highly sensitive to set and setting.

T1: 15 – I transition out of the hole as my physical body becomes more difficult to ignore. It does not take much effort to sit back upright and operate a computer again. I still feel very heavy, I still feel very dazed. Every function of my body and mind feels like I am in slow motion. I often just space out for a few seconds at a time, not really thinking about anything, just perceiving the state I am in. The room is dark. There are visuals drifting down the surfaces and indistinct dark spaces all around me, cascades of regular arrays of dots, shifting and morphing a little. Everything is gently flashing. As the shock of being in a hole state wears off and my normal cognition begins to quickly reassemble and filter back in, I just go back to reading about things on my laptop. I read about the phenomenon of hypnosis. I feel like I am made of gummy. My limbs feel heavy and buzzing and moving them is labored. But I am content to move as minimally as possible.

T1:30- Everything feels so slow. I am surprised to realize only an hour and a half has passed. The time dilation, particularly in the hole space, is remarkable. The intensity has leveled off at this point, I am sitting there in a focused daze like a monsoonal downpour of doom metal riffs is crashing down on me. I am not stupefied, incapacitated, or blankly staring off into space, but the presence of the drug is still overwhelmingly undeniable.

T2:00- I still feel the same as before. The comedown seems steady and gradual. There's no mania, but still a focused drive to read things and engage in tasks. There is still a bit of slowness in my thoughts and reactions, like each neural impulse has to fight through slush to reach the next synapse, but the pieces to be a functional mind are all still there. It is a focus but it is a soft focus, still blurred, still not at full capacity. MXPr in its comedown left me confused and frozen in place, unable to really think or do anything and leaving me no desire to engage with anything. This is quite different from that. It's a perfect state to competently engage with a mostly mindless videogame, in this case, I dust off my N64 cartridge of Pokemon snap and try to max out my scores. I become engrossed with finding an online leaderboard for this ancient game and find a quiet joy in seeing all these people from around the world still dedicating themselves to being the very best they can be for the sake a game hardly anyone plays anymore for only the most niche recognition. I find my mind, in its exposed softness, has taken itself to that sort of saccharine sentimentality, there are a lot of little beautiful things in the dark and quiet places in the world late at night, on pages of website with hardly any traffic, or perhaps a drug is just making me feel something profound about the dick-measuring contest of hyper-competitive gaming for dubious achievements that will forever be shrouded in total obscurity. But perhaps I am doing the

same with drugs.

T3:00- I definitely feel further down. Cognitively I am close to being back to baseline, though I still feel suggestible and malleable- things like immediately believing obvious misinformation before scrutinizing it, fixation on certain thoughts or beliefs, I feel as though the right person could convince me to believe or do anything right now if they communicated it in the right way. Most of the remaining sensations are in my body- now just as numbness and heaviness. There is perhaps a bit of lingering stimulation in my mind, not true "stimulation" as in anything I can overtly feel, just that I would probably have a hard time falling asleep if I were to lay down right now.

T4:00- Almost entirely down. Just the last lingering vestiges of that aforementioned numbness and heaviness in my body.

T5:00- Fully back to baseline. Go to sleep (With my prescribed 50 mg of Trazodone).

Conclusion: I think this drug is excellent as a heavier dissociative for casual use- I think many users will even find it preferable to ketamine- not just because of its higher potency, but because of the slightly more engaging and lucid headspace too, at points quite euphoric and focused and sentimental without becoming too confusing or disorienting. The higher potency of course does mean that it may lend itself less to casual use as one can not eye out doses like they do with ketamine, but I find this one to be pretty forgiving at high doses, owing to its that somewhay lucid headspace. The heaviness is mostly in the body and even at a very large dose it wasn't particularly disorienting, though it could be physically incapacitating. It has a very rapid onset with sudden upwellings of euphoria, a short peak duration and a longer, pleasant, functional comedown that is overall quite agreeable. The hole space is dim and indistinct but still interesting and quite malleable to whatever sensory inputs one lends themselves to. I believe holing on this drug with the appropriate music could provide for some phenomenal experiences, but on the flipside, it may prove very sensitive to set and setting and in the wrong place at the wrong time could be an unpleasant experience. It doesn't have quite the same level of esoteric thought and deep-diving insight as DCK might have- in fact if I had to describe it based on comparison I would say the most accurate description is a slightly more stimulating DCK with a slightly shallower and more casual headspace- a headspace that I find projects itself outwardly onto the user's inputs and surroundings as opposed to the inwardly gazing world of DCK. A great way to finish off a dark night. As I stated in the
